**Management of Fusarium Species and Their Mycotoxins in Cereal Food and Feed** Thomas Miedaner,Daniela Gwiazdowska,Agnieszka Waśkiewicz,2017-11-10 Health and safety of food and feed are the most important criteria for their quality. The quality of feed is in turn important for animal health, the environment and for the safety of food from animal origin. Fungi belonging to the Fusarium genus are widespread in crops causing plant diseases and producing toxic metabolites. Fusarium species can colonize plants during their growth on the field and cause serious damage in terms of yield and quality of harvested grains. One of the most important fungal diseases of wheat and other cereals in the world is

Fusarium head blight caused by the fungal pathogens *Fusarium graminearum* and *Fusarium culmorum* and others. In addition, these fungi produce mycotoxins, contaminating food and feed. The most important *Fusarium* mycotoxins include trichothecenes, zearalenone and fumonisins, primarily because of their prevalence, but also because of the toxic effect to humans and animals. However, these fungi produce also other mycotoxins such as moniliformin, beauvericin, enniatin or fusarins. Food and feed can be contaminated with mycotoxins at various stages in the production chain resulting in serious problems with health, safety and economic losses. It is estimated that 25% of the crop in the world each year are contaminated with these metabolites, the problem affects both industrialized countries and developing countries. The aim of this Research Topic of *Frontiers in Microbiology* is to publish state of the art research about occurrence and genomics of *Fusarium* species and their mycotoxins in the whole food and feed chain starting from the crops as well as implications for health and economic aspects. This research topic highlights the current knowledge on the plant diseases caused by *Fusarium* fungi as well as all aspects of *Fusarium* mycotoxin contamination of crops, food and feed, taking into account decontamination methods.

Biomarkers for Traumatic Brain Injury Alan H.B. Wu, W. Frank Peacock, 2020-07-10 *Biomarkers for Traumatic Brain Injury* provides a comprehensive overview on the selection and implementation of serum-based and saliva-based biomarkers for traumatic brain injury. The book presents an economic analysis for implementing TBI biomarkers into clinical practice. In addition, it discusses the analytical tools needed to implement TBI biomarkers, including specifications for testing instruments and interpretative software. Neurologists, emergency department physicians, intensivists, and clinical laboratorians will find this book a great resource from which to familiarize themselves with the issues and processes regarding TBI biomarkers. Approximately 2 million people in the U.S. sustain a traumatic brain injury (TBI) each year with over 250,000 hospitalizations and 50,000 deaths. There has been a significant rise in interest in diagnosing mild concussions, particularly in the sports world. While imaging has been the gold standard, these procedures are costly and not always available. There is great potential in using serum-based biomarkers, hence the book seeks to enlighten readers on new possibilities. - Offers strategies for the selection and implementation of traumatic brain injury biomarkers - Discusses the importance of autoantibodies and post translational modifications for TBI - Covers the analytical tools needed to implement TBI biomarkers, including the specifications for testing instruments and interpretative software
