**The Sago Palm** Society of Sago Palm Studies, 2015 In order to produce sufficient quantities of food to feed the world's growing population, we need to increase the food producing capacities of crops and to protect the environments in which they grow. Discovering untapped plant resources is an important challenge, but a haphazard increase in food production may cause environmental damage. We need foresight and must take sound appropriate actions. The sago palm is a plant that might fulfill all of these requirements. The sago palm accumulates more starch than any other plant in the world, yet, in global terms, it continues to languish in relative obscurity. The Japanese Society of Sago Palm Studies was formed in the hope of raising its profile by hosting seminars and symposiums in Japan and overseas to help it achieve the recognition it deserves. To this end, the Society's members have worked together to produce this volume, written in an easy-to-read style. [Subject: Botany, Agriculture, Conservation, Environmental Studies]

**Electromagnetic Technologies for Medical Diagnostics** Lorenzo Crocco, Panos Kosmas, 2019-04-02 Electromagnetic (EM) radio-wave technologies for medical imaging represent an emerging alternative diagnostic modality with some unique features, which is attracting the attention of many researchers worldwide. Diagnostic devices based on EM technology have no side-effects, as they exploit non-ionizing radiation, and their intrinsic low cost makes them sustainable for healthcare systems. This Special Issue provides a comprehensive account of this very active research area by gathering contributions that cover a variety of topics ranging from fundamental research questions to experimental validation and clinical translation.

Glial Interfaces in the Nervous System Håkan Aldskogius, John Fraher, 2002 Glial cells are commonly viewed as subordinate players to the functional requirements of neighbouring neurons - in normal as well as pathological conditions. These neuron-glial interactions are crucial for the development, maintenance, plasticity and repair of the nervous system.

They are also dependent upon and/or influenced by interactions between glial cells themselves.

*Methods in Renal Toxicology* Rudolfs K. Zalups,Lawrence H. Lash,1996-03-14 The only up-to-date compilation of renal methods available, this book is the definitive resource for any renal researcher eager to stay ahead. Methods in Renal Toxicology presents a vast array of methods for the study of renal cellular and tubular structure, function, and biochemistry under physiological, toxicological, and pathological conditions. It provides detailed descriptions in easy-to-understand language of methods designed to enhance your research efforts. Methods in Renal Toxicology puts you on the cutting edge with valuable chapters detailing molecular methods and transgene and gene targeting - the most recent approaches to the study of renal toxicology. Overall, the book's topics range from non-invasive assessments of renal function in the whole animal and clinical settings to cellular and molecular approaches. Specifically, the book delves into measurements of clearance and urinary markers, histopathology, and methods to assess renal carcinogenesis, mutagenesis, oxidative stress, mitochondria injury, cellular repair, and drug metabolism and transport. A variety of in vitro methods are also described,

including the isolated perfused kidney, micropuncture, microperfusion, microdissection, renal slices, isolated perfused tubules, suspensions of tubules and isolated cells, and primary cell cultures and cell lines. *Methods in Renal Toxicology* is a must-have resource for all renal investigators. Nowhere else can you find concise descriptions of traditional and up-to-the-minute renal toxicology methods in such a practical, well-written single-volume guide.

**Plant Single Cell Type Systems Biology** Marc Libault,Sixue Chen,2016-09-06 The phenotype of a plant in response to a stress condition is the reflection of the molecular responses in different cell-types composing the plant. The multicellular complexity represents a challenge when accessing specific responses of each cell or cell type composing the plant. To overcome this difficulty and allow the clear characterization of the plant cell molecular mechanisms, the research community is now focusing on studying a single cell and single cell-types. The isolation of plant single cells is limited by the cell wall that confers the rigidity of the plant and its overall structure. Various methods have been developed for isolating plant cells (e.g. laser capture microdissection; cell sorting of Green Fluorescent Protein (GFP)-tagged protoplasts, differential protoplastization of cells such as guard cells, isolation of easily accessible cell types such as cotton fiber, pollen cells, trichomes and root hair cells). The development of these innovative approaches to isolate single plant cells or cell-types combined with the application of sensitive and high-throughput technologies allows a better analysis of the developmental processes and response to environmental stresses. Ultimately, single plant cell and cell-type biology will lead to establishment of more reliable and accurate -molecular regulatory networks at the resolution of basic life unit. The goal of this Research Topic is to cover new technological and biological advances in the study of plant single cell, cell-type and systems biology.

**Infrared Absorbing Dyes** Masaru Matsuoka,2013-06-29 New laser technology has developed a new dye chemistry! Development of the gallium-arsenic semiconductor laser (diode laser) that emits laser light at 780-830 nm has made possible development of new opto-electronic systems including laser optical recording systems, thermal writing display systems, laser printing systems, and so on. Medical applications of lasers in photodynamic therapy for the treatment of cancer were also developed. In such systems, the infrared absorbing dyes (OR dyes) are currently used as effective photoreceivers for diode lasers, and will become the key materials in high technology. At the present time the chemistry of IR dyes is the most important and interesting field in dye chemistry. Laser light can be highly monochromatic, very well collimated, coherent, and, in some cases, extremely powerful. These characteristics make diode lasers a very cheap, convenient, and useful light source for a variety of applications in science and technology. For these purposes, however, IR dyes with special characteristics are required. To develop new IR dyes, it is most important to establish the correlation between the chemical structures of dyes and other characteristics of dyes, such as their absorption spectra. Molecular design of IR dyes predicting the  $\lambda_{max}$  and  $\epsilon_{max}$  values by molecular orbital (MO) calculations is now possible even by using a personal computer, and many types of new IR dyes have been demonstrated. Also, new opto-electronic systems using IR dyes as photoreceivers have been reported recently.
