**The Enzyme Treatment of Cancer and Its Scientific Basis** John Beard, 2010-01-01 In 1902, the scientist John Beard, at the time Professor at the University of Edinburgh, proposed that the pancreatic enzyme trypsin represents the body's primary defense against cancer and would be useful as a cancer treatment. Despite his documentation and reputation he was nominated for the Nobel Prize in 1906 for his work in embryology but most cancer experts rejected Beard's thesis outright. However, not everyone dismissed Beard. A number of physicians employed pancreatic enzymes in the treatment of patients diagnosed with advanced cancer, often with remarkable results as reported in the scientific literature. These successes provoked a heated debate about the therapy in the first decade of the 20th century. In 1911 Beard published *The Enzyme Treatment of Cancer and Its Scientific Basis*, outlining his hypothesis, and the compelling results. Though published to some very positive reviews, the book was soon forgotten as the scientific community enthusiastically latched on to Madame Curie's claim that radiation represented a simple non-toxic cure for cancer. It would be years before scientists realized radiation cured few cancers and was quite toxic but Madame Curie herself died as a result of her exposure to uranium. Though Beard died in relative obscurity in 1924, contemporary evidence from molecular biology confirms many of his precepts. In 2010, nearly 100 years since publication of this book, it is time Beard's work be reread. With billions of dollars spent in recent decades on cancer research with only slight success, Beard's thesis warrants a thorough reconsideration.

*What Went Wrong* Nicholas J. Gonzalez, 2012 In 1998, Nicholas Gonzalez, M.D. received National Cancer Institute approval for a clinical trial to evaluate his nutritional-enzyme approach in the treatment of patients with pancreatic cancer. Though Dr. Gonzalez hoped the venture would initiate an era of cooperation between conventional scientists and serious alternative researchers, problems plagued the study from its beginning. The design discouraged patient participation; conventional oncologists discouraged patients from joining and at times pressured those already admitted for nutritional therapy to change to more conventional treatment. Then in 2000 the NCI insisted that all patient selection decisions be turned over to the Principal Investigator, who as it turned out helped develop the chemotherapy protocol used as the control treatment. Repeatedly, the Principal Investigator approved patients for the nutritional treatment who did not meet the entry requirements, or who were too ill or uncommitted to follow the self-administered regimen. An evaluation by government

scientists in early 2005 confirmed that so many patients had failed to follow the prescribed nutritional therapy that the data had little meaning. Despite such problems, without Dr. Gonzalez's knowledge the Principal Investigator published an article implying the study was properly run, patients complied fully and that the nutritional therapy had no effect. In response, Dr. Gonzalez, a former journalist, has written *What Went Wrong*, to bring the truth of this project to light, and show how bias, indifference, and at times incompetence undermined a promising research effort that, if properly run, might have ushered in a new direction in cancer treatment.

Enzyme Nutrition Edward Howell, 1995-01-01 Why is eating food in its natural state, unprocessed and unrefined, so vital to the maintenance of good health? What is lacking in our modern diet that makes us so susceptible to degenerative disease? What natural elements in food may play a key role in unlocking the secrets of life extension? These fascinating questions, and many more, are answered in *Enzyme Nutrition*. Written by one of America's pioneering biochemists and nutrition researchers, Dr. Edward Howell, *Enzyme Nutrition* presents the most vital nutritional discovery since that of vitamins and minerals—food enzymes. Our digestive organs produce some enzymes internally, however food enzymes are necessary for optimal health and must come from uncooked foods such as fresh fruits and vegetables, raw sprouted grains, unpasteurized dairy products, and food enzyme supplements. *Enzyme Nutrition* represents more than fifty years of research and experimentation by Dr. Howell. He shows us how to conserve our enzymes and maintain internal balance. As the body regains its strength and vigor, its capacity to maintain its normal weight, fight disease, and heal itself is enhanced.

One Man Alone Nicholas J. Gonzalez, 2010

**The Trophoblast and the Origins of Cancer** Nicholas J. Gonzalez, Linda L. Isaacs, 2009-01-01 This groundbreaking analysis reveals how more than 100 years ago, the English scientist Dr. John Beard uncovered not only the likely origins of cancer but also its solution. Dr. Gonzalez explains Dr. Beard's underlying theory and explores Dr. Beard's pioneering use of pancreatic enzymes for cancer treatment. This book also showcases case histories describing cancer patients successfully treated with pancreatic enzymes by the authors. Dr. Beard's achievements, though unappreciated in his own day, are many. A research embryologist by training, he proposed that the early mammalian placenta, or trophoblast, the connection between the embryo and the maternal uterine blood supply, represents an ideal model for the study of malignancy. In its ability to divide rapidly, invade maternal tissues, and generate a blood supply, the trophoblast, Beard reasoned, initially behaves as any growing tumor might. However, the trophoblast differs from malignancy, Beard stated, because at some predetermined point it changes from an invasive tissue into the non-aggressive placenta, necessary for early embryonic life. Beard spent years searching for the key to this remarkable transformation, ultimately discovering that the very day the trophoblast changes character, the embryonic pancreas begins secreting large amounts of enzymes. Beard then proposed that since pancreatic enzymes regulate trophoblast growth, they must represent our main defense against cancer. Subsequently, in

animal experiments and in clinical use with human cancer patients, Beard demonstrated pancreatic enzymes could attack and destroy cancerous tumors. In this book, you will read of Dr. Beard's discoveries, and how modern science confirms much of what he long ago proposed. Along the way, you will learn that Dr. Beard discovered stem cells, the focus of much research effort today, though he never received proper credit. And you will see that Dr. Beard may have uncovered the key to the deadly

*Therapeutic Enzymes: Function and Clinical Implications* Nikolaos Labrou, 2019-09-03 Therapeutic enzymes exhibit fascinating features and opportunities, and represent a significant and promising subcategory of modern biopharmaceuticals for the treatment of several severe diseases. Research and drug developments efforts and the advancements in biotechnology over the past twenty years have greatly assisted the introduction of efficient and safe enzyme-based therapies for a range of both rare and common disorders. The introduction and regulatory approval of twenty different recombinant enzymes has enabled effective enzyme-replacement therapy. This volume aims to overview these therapeutic enzymes, focusing in particular on more recently approved enzymes produced by recombinant DNA technology. This volume is composed of four sections. Section 1 provides an overview of the production process and biochemical characterization of therapeutic enzymes, while Section 2 focuses upon the engineering strategies and delivery methods of therapeutic enzymes. Section 3 highlights the clinical applications of approved therapeutic enzymes, including aspects on their structure, indications and mechanisms of action. Together with information on these mechanisms, safety and immunogenicity issues and various adverse events of the recombinant enzymes used for therapy are discussed. Section 4, provides discussion on the prospective and future developments of new therapeutic enzymes. This book is aimed at academics, researchers and students undertaking advanced undergraduate/postgraduate programs in the biopharmaceutical/biotechnology area who wish to gain a comprehensive understanding of enzyme-based therapeutic molecules.

**Organ Donation and Transplantation** Georgios Tsoulfas, 2018-07-25 One of the most interesting and at the same time most challenging fields of medicine and surgery has been that of organ donation and transplantation. It is a field that has made tremendous strides during the last few decades through the combined input and efforts of scientists from various specialties. What started as a dream of pioneers has become a reality for the thousands of our patients whose lives can now be saved and improved. However, at the same time, the challenges remain significant and so do the expectations. This book will be a collection of chapters describing these same challenges involved including the ethical, legal, and medical issues in organ donation and the technical and immunological problems the experts are facing involved in the care of these patients. The authors of this book represent a team of true global experts on the topic. In addition to the knowledge shared, the authors provide their personal clinical experience on a variety of different aspects of organ donation and transplantation.

*Intestinal Lipid Metabolism* Charles M. Mansbach II, Patrick Tso, Arnis Kuksis, 2011-06-28 This book was stimulated by the enthusiasm shown by attendees at the meetings in Saxon River, VT, sponsored by the Federation of American Societies for

Experimental Biology (FASEB), on the subject of the intestinal processing of lipids. When these meetings were first started in 1990, the original organizers, two of whom are editors of this volume (CMM and PT), had two major goals. The first was to bring together a diverse group of investigators who had the common goal of gaining a better understanding of how the intestine absorbs lipids. The second was to stimulate the interest of younger individuals whom we wished to recruit into what we believed was an exciting and fruitful area of research. Since that time, the field has opened up considerably with new questions being asked and new answers obtained, suggesting that our original goals for the meetings were being met. In the same spirit, it occurred to us that there has not been a recent book that draws together much of the information available concerning how the intestine processes lipids. This book is intended to reach investigators with an interest in this area and their pre- and post doctoral students. The chapters are written by individuals who have a long-term interest in the areas about which they write, and many have been speakers at the subsequent FASEB conferences that have followed on the first.

The Exocrine Pancreas Stephen Pandol,2011 The secretions of the exocrine pancreas provide for digestion of a meal into components that are then available for processing and absorption by the intestinal epithelium. Without the exocrine pancreas, malabsorption and malnutrition result. This chapter describes the cellular participants responsible for the secretion of digestive enzymes and fluid that in combination provide a pancreatic secretion that accomplishes the digestive functions of the gland. Key cellular participants, the acinar cell and the duct cell, are responsible for digestive enzyme and fluid secretion, respectively, of the exocrine pancreas. This chapter describes the neurohumoral pathways that mediate the pancreatic response to a meal as well as details of the cellular mechanisms that are necessary for the organ responses, including protein synthesis and transport and ion transports, and the regulation of these responses by intracellular signaling systems. Examples of pancreatic diseases resulting from dysfunction in cellular mechanisms provide emphasis of the importance of the normal physiologic mechanisms.
