Advances in Comparative Physiology and Biochemistry V8 O Lowenstein, 2012-12-02 *Advances in Comparative Physiology and Biochemistry*, Volume 8, presents five papers covering topics that range from biochemical aspects of the genetics of the various mutants of the fruit fly *Drosophila* to the physiological, biophysical, and biochemical mechanisms in diving animals. The first study on the biochemistry and genetics of purine metabolism in *Drosophila melanogaster* examines purine nucleotide biosynthesis and interconversion, catabolism of purines, genetics of catabolic enzymes, and purine auxotrophy. The second study on central nervous system regulation of pituitary melanocyte-stimulating hormone presents experiments with amphibians, reptiles, and mammals that test nervous-neuroendocrine control of MSS release. The third study examines the comparative physiology of calcium regulation in submammalian vertebrates, including fishes, amphibians, and birds. The fourth study looks at the cerebellum of fishes. The final paper deals with the comparative physiology of diving in vertebrates. The book will be useful to biologists given their appreciation of functional biological principles, as well as a reference tool for specialists.

Neurovision: Neural bases of binocular vision and coordination and their implications in visual training programs Olivier A. Coubard, 2015-10-12 Binocular vision is achieved by five neurovisual systems originating in the retina but varying in their destination within the brain. Two systems have been widely studied: the retino-tectal or retino-collicular route, which subserves an expedient and raw estimate of the visual scene through the magnocellular pathway, and the retino-occipital or retino-cortical route, which allows slower but refined analysis of the visual scene through the parvocellular pathway. But there also exist further neurovisual systems: the retino-hypothalamic, retino-pretectal, and accessory optic systems, which play a crucial role in vision though they are less understood. The retino-pretectal pathway projecting onto the pretectum is critical for the pupillary or photomotor reflex. The retino-hypothalamic pathway projecting onto the

suprachiasmatic nucleus regulates numerous behavioral and biological functions as well as circadian rhythms. The accessory optic system targeting terminal lateral, medial and dorsal nuclei through the paraoptic fasciculus plays a role in head and gaze orientation as well as slow movements. Taken together, these neurovisual systems involve 60% of brain activity, thus highlighting the importance of vision in the functioning and regulation of the central nervous system. But vision is first and foremost action, which makes perception impossible without movement. Binocular coordination is a prerequisite for binocular fusion of the object of interest on the two foveas, thus ensuring visual perception. The retino-collicular pathway is sufficient to elicit reflexive eye movements with short latencies. Thanks to its motor neurons, the superior colliculus activates premotor neurons, which themselves activate motor neurons of the oculomotor, trochlear and abducens nuclei. At a higher level, a cascade of neural mechanisms participates in the control of decisional eye movements. The superior colliculus is controlled by the substantia nigra pars reticulata, which is itself gated by subcortical structures such as the dorsal striatum. The superior colliculus is also inhibited by the dorsolateral prefrontal cortex through a direct prefrontotectal tract. Cortical areas are crucial for the triggering of eye movements: the frontal eye field, supplementary eye field, and parietal eye field. Finally the cerebellum maintains accuracy. The focus of the present research topic, entitled Neural bases of binocular vision and coordination and their implications in visual training programs, is to review the most recent findings in brain imaging and neurophysiology of binocular vision and coordination in humans and animals with frontally-placed eyes. The emphasis is put on studies that enable transfer of knowledge toward visual training programs targeting visual field defects (e.g., hemianopia) and binocular functional disorders (e.g., amblyopia).

Flat Out and Fearless Peter Lindenberg, 2022-10-24 With a racing career spanning more than four decades, coming second is never an option for Peter Lindenberg. Troubled by a lack of self-confidence, Peter's 'average' childhood saw a bitter parent who doubted his abilities, a demanding school system that forced him to fit the mould, a younger brother who was better at everything, and brutal, undeserved beatings with a sjambok. But when Peter tasted the buzz of barefoot water-skiing he found it impossible to resist, and went on to break records, earn numerous Springbok Colours, and win many world championships. This, however, was just the start. Little did Peter know the sporting magic that would follow in his life – first as a powerboat racer and then as a race car driver. Despite counting on pins and metal to hold his battered body intact, being arrested unjustly, a serious motor racing accident with his car going up in flames, and a brain haemorrhage, Peter keeps going flat out and quickly ranks on the international championship charts, cheats death twice, and presses the reset button to positively influence a failed marriage. Flat Out and Fearless is Peter's cut-to-the-chase life journey that has rendered him one bionic man who is proud of his blatant honesty and his courageous quest to uplift and transform the lives of the downtrodden.

Neurons and Networks John E. Dowling, 2001 Completely revised and enlarged with six new chapters, the second edition

of Neurons and Networks is an introduction not just to neurobiology, but to all of behavioral neuroscience. It is an ideal text for first- or second-year college students with minimal college science exposure.

Advances in Invertebrates and Fish Telemetry Jean Paul Lagardere, Marie-Laure Begout Anras, Guy Claireaux, 2012-12-06
This volume provides a selection of the most significant papers presented at the Second Conference on Fish Telemetry in Europe in La Rochelle, France, in April 1997. The conference was attended by 100 scientists from 18 countries. The contributions are grouped under the following headings: Methodology and New Developments, Tagging Procedures, Behavioural and Physiological Ecology, Fish Migration, Stock Management and Conservation. Particular emphasis was put on tag miniaturisation, multiple functions and sampling strategies. Papers concerned the effects of tags on fish for consolidating behavioural or original physiological investigations noticeably more open to the marine environment. Methods were essentially applied to study the relationships between fish and their natural environment. Besides providing up-to-date information on the state of fish telemetry, the book illustrates the increase in spatial and temporal scales and the number of tracked fish which gives a statistical basis for field study in behavioural ecology.
