Studies of Cave Sediments Ira D. Sasowsky, John Mylroie, 2004 This book is for geoscience researchers and students with interests in climate change, paleohydrology, and sedimentology. Studies of Cave Sediments is unique in that it is the first comprehensive volume on cave sediments, provides case-studies from around the world, gives guidance on appropriate applications of techniques, and their limitations, synthesizes methods that can be used to decipher complex deposits, and includes chemical deposits (speleothems) as well as clastic sediments.

Pleistocene and Holocene Hunter-gatherers in Iberia and the Gibraltar Strait Robert Sala, Robert Sala Ramos, Eudald Carbonell, 2014 This volume aims to offer an up-to-date summary of knowledge relating to human predatory societies settled in Iberia. The archaeological record of the region is essential for the reconstruction of human evolution in Europe in biological, behavioural and cultural domains as it reserves the earliest and more significant records of the humanization of the continent and because it allows the reconstruction of the main trends in that process. This is possible thanks to a rich, large and complete record, encompassing all the stages of that development and all the adaptive and cultural modes. Moreover, the discovery of that record is amongst the earliest known archaeological occurrences in the history of archaeology. The book offers a systematic presentation of the current empirical data written by the same research teams already working every year on site excavations. Included is current knowledge of the main archaeo-palaeontological sites with the most significant records. Sites are arranged in eight physiographic and geological regions, with the aim of making clear the adaptive ways of human societies to similar environments. Over 400 illustrations, tables and figures, most in colour.

Human Paleontology and Prehistory Assaf Marom, Erella Hovers, 2017-01-24 The aim of the book is to present original and thought-provoking essays in human paleontology and prehistory, which are at the forefront of human evolutionary research, in honor of Professor Yoel Rak (a leading scholar in paleoanthropology). The volume presents a collection of original papers contributed by many of Yoel's friends and colleagues from all over the globe. Contributions from experts around the globe fall roughly into three broad categories: Reflections on some of the broad theoretical questions of evolution, and especially about human evolution; the early hominins, with special emphasis on Australopithecus afarensis and Paranthropus; and the Neanderthals, that contentious group of our closest extinct relatives. Within and across these categories, nearly every paper addresses combinations of methodological, analytical and theoretical questions that are

pertinent to the whole human evolutionary time span. This book will appeal most to scholars and advanced students in paleoanthropology, human paleontology and prehistoric archaeology.

**An Introduction to Human Evolutionary Anatomy** Leslie Aiello, Christopher Dean, 1990-09-11 An anthropologist and an anatomist have combined their skills in this book to provide students and research workers with the essentials of anatomy and the means to apply these to investigations into hominid form and function. Using basic principles and relevant bones, conclusions can be reached regarding the probable musculature, stance, brain size, age, weight, and sex of a particular fossil specimen. The sort of deductions which are possible are illustrated by reference back to contemporary apes and humans, and a coherent picture of the history of hominid evolution appears. Written in a clear and concise style and beautifully illustrated, *An Introduction to Human Evolutionary Anatomy* is a basic reference for all concerned with human evolution as well as a valuable companion to both laboratory practical sessions and new research using fossil skeletons.

**Vertebrate Taphonomy** R. Lee Lyman, 1994-07-07 Taphonomy studies the transition of organic matter from the biosphere into the geological record. It is particularly relevant to zooarchaeologists and paleobiologists, who analyse organic remains in the archaeological record in an attempt to reconstruct hominid subsistence patterns and paleoecological conditions. In this user-friendly, encyclopedic reference volume for students and professionals, R. Lee Lyman, a leading researcher in taphonomy, reviews the wide range of analytical techniques used to solve particular zooarchaeological problems, illustrating these in most cases with appropriate examples. He also covers the history of taphonomic research and its philosophical underpinnings. Logically organised and clearly written, the book is an important update on all previous publications on archaeological faunal remains.

**Handbook of Paleoanthropology** Winfried Henke, Ian Tattersall, 2007-05-10 This 3-volume handbook brings together contributions by the world's leading specialists that reflect the broad spectrum of modern palaeoanthropology, thus presenting an indispensable resource for professionals and students alike. Vol. 1 reviews principles, methods, and approaches, recounting recent advances and state-of-the-art knowledge in phylogenetic analysis, palaeoecology and evolutionary theory and philosophy. Vol. 2 examines primate origins, evolution, behaviour, and adaptive variety, emphasizing integration of fossil data with contemporary knowledge of the behaviour and ecology of living primates in natural environments. Vol. 3 deals with fossil and molecular evidence for the evolution of *Homo sapiens* and its fossil relatives.

**Human Tooth Crown and Root Morphology** G. Richard Scott, Joel D. Irish, 2017-03-16 A valuable guide to scoring crown and root traits in human dentitions for ancestry estimation and biodistance analysis.

**Debris-flow Hazards and Related Phenomena** Matthias Jakob, Oldrich Hungr, 2007-12-26 With climate change and deforestation, debris flows and debris avalanches have become the most significant landslide hazards in many countries. In recent years there have been numerous debris flow avalanches in Southern Europe, South America and the Indian

Subcontinent, resulting in major catastrophes and large loss of life. This is therefore a major high-profile problem for the world's governments and for the engineers and scientists concerned. Matthias Jakob and Oldrich Hungr are ideally suited to edit this book. Matthias Jakob has worked on debris flow for over a decade and has had numerous papers published on the topic, as well as working as a consultant on debris flow for municipal and provincial governments. Oldrich Hungr has worked on site investigations on debris flow, avalanches and rockfall, with emphasis on slope stability analysis and evaluation of risks to roads in built-up areas. He has also developed mathematical models for landslide dynamic analysis. They have invited world-renowned experts to join them in this book.

**The Neanderthal's Necklace** Juan Luis Arsuaga, 2009-04-29 Neanderthals are at the center of this compelling narrative by Europe's leading anthropologist, not because they were our ancestors but because they were not. Members of a parallel humanity that evolved in Europe for hundreds of thousands of years, they were in direct competition with Cro-Magnons -- modern humans. The way Neanderthals lived and the reasons why they disappeared 50,000 years ago offer a surprising mirror in which we can examine and learn more about ourselves. Illustrated, concise and readable, this is a fascinating exploration of human origins. Lively, personal, refreshing, and instructive, this book should be read by anyone interested in their own origins and our extinct relatives. -- Ian Tattersall, author of *The Fossil Trail*, *The Last Neanderthal*, and *Becoming Human*

**Mechanical Composition of Clastic Sediments** J. A. Udden, 1914

**Homo Britannicus** Chris Stringer, 2007-06-28 HOMO BRITANNICUS tells the epic history of life in Britain, from man's very first footsteps to the present day. Drawing on all the latest evidence and techniques of investigation, Chris Stringer describes times when Britain was so tropical that man lived alongside hippos and sabre tooth tiger, times so cold we shared this land with reindeer and mammoth, and times colder still when we were forced to flee altogether. This is the first time we have known the full extent of this history: the Ancient Human Occupation of Britain project, led by Chris, has made discoveries that have stunned the world, pushing back the earliest date of arrival to 700,000 years ago. Our ancestors have been fighting a dramatic battle for survival here ever since.

The Earliest Europeans Robert Hosfield, 2020-05-31 *The Earliest Europeans* explores the early origins of man in Europe through the perspective of 'a year in the life': how hominins in the Lower Palaeolithic coped with the year-round practical challenges of mid-latitude Europe with its distinctive temperatures, seasonality patterns, and available resources. Current research has provided increasingly robust archaeological and Quaternary Science records, but there are ongoing uncertainties as to both the earliest Europeans' specific survival strategies and behaviours, and the character of their dispersals into Europe. In short, how sustained and 'successful' were the individual phases of European occupation by Lower Palaeolithic hominins and what sorts of 'human' were they? Using a season-by-season chapter structure to explore, for

example, the contrasting demands and opportunities of winter versus summer survival, Hosfield explores how foods and other resources would vary across the four seasons in quantity and quality, and the resulting implications for hominin behaviours. Text boxes provide the background on key issues, and the book draws on a range of supporting evidence including technology (e.g. the nature of Lower Palaeolithic stone tools; the evidence for organic tools), hominin life history (e.g. the length of infant dependency; the nature of 'parenting'; the implications of different mating models; the Social Brain Hypothesis), cognitive studies (e.g. brain scanning research into possible planning capabilities) and potential bias in the archaeological record (e.g. in terms of what is and isn't preserved). By testing the likelihood of different scenarios by comparing short-term, site-based insights with long-term, regional trends, Hosfield is able to put forward ideas on how our earliest European ancestors survived and what their lives were like.

**Bones, Stones and Molecules** David W. Cameron, Colin P. Groves, 2004-07-08 *Bones, Stones and Molecules* provides some of the best evidence for resolving the debate between the two hypotheses of human origins. The debate between the 'Out of Africa' model and the 'Multiregional' hypothesis is examined through the functional and developmental processes associated with the evolution of the human skull and face and focuses on the significance of the Australian record. The book analyzes important new discoveries that have occurred recently and examines evidence that is not available elsewhere. Cameron and Groves argue that the existing evidence supports a recent origin for modern humans from Africa. They also specifically relate these two theories to interpretations of the origins of the first Australians. The book provides an up-to-date interpretation of the fossil, archaeological and the molecular evidence, specifically as it relates to Asia, and Australia in particular. - Readily accessible to the layperson and professional - Provides concise coverage of current scientific evidence - Presents a robust computer-generated model of human speciation over the last 7 million years - Well illustrated with figures and photographs of important fossil specimens - Presents a synthesis of great ape and human evolution

**The Human Inheritance** Bryan Sykes, 1999 Very little excites human curiosity quite so much as contemplating human origins. More than any other branch of science, evolution - and human evolution in particular - is fraught with controversy. Working from what is essentially the same data, schools of opinion have come to diametrically opposed conclusions. Are we adapted Neanderthals, or a new species altogether which wiped them out? Did the first Americans enter the continent 30,000 or 12,000 years ago? Did the Polynesians sail against wind and current to an unknown fate, or were they just blown across from South America while out fishing? Why do we speak different languages? Is it because language traces our biological history, or are the two things completely unrelated? Evolution, because it deals with a past that can never conclusively be known, was once ideal material for perpetual debate. Enter genetics with a completely new source of objective data. Surely these old questions would soon be settled one way or another. Or would they? Bryan Sykes brings together a world-class set of contributors to debate these questions. The result is eight lively essays, each of which offers a different opinion about what

the links between genes, language, and the archaeological record can tell us about human evolution - and indeed, whether they can tell us anything conclusive at all. This stimulating and challenging book poses more questions than it offers answers, eschews jargon, and pursues controversy. Guaranteed to fascinate anyone who has ever wondered how the fossil record, the incredible diversity of human language, and our genetic inheritance might combine to give a glimpse of human origins.

**Almost Human** Lee Berger, John Hawks, 2017-05-09 This first-person narrative about an archaeological discovery is rewriting the story of human evolution. A story of defiance and determination by a controversial scientist, this is Lee Berger's own take on finding *Homo naledi*, an all-new species on the human family tree and one of the greatest discoveries of the 21st century. In 2013, Berger, a National Geographic Explorer-in-Residence, caught wind of a cache of bones in a hard-to-reach underground cave in South Africa. He put out a call around the world for petite collaborators—men and women small and adventurous enough to be able to squeeze through 8-inch tunnels to reach a sunless cave 40 feet underground. With this team of underground astronauts, Berger made the discovery of a lifetime: hundreds of prehistoric bones, including entire skeletons of at least 15 individuals, all perhaps two million years old. Their features combined those of known prehomínids like Lucy, the famous *Australopithecus*, with those more human than anything ever before seen in prehistoric remains. Berger's team had discovered an all new species, and they called it *Homo naledi*. The cave quickly proved to be the richest prehomínid site ever discovered, full of implications that shake the very foundation of how we define what makes us human. Did this species come before, during, or after the emergence of *Homo sapiens* on our evolutionary tree? How did the cave come to contain nothing but the remains of these individuals? Did they bury their dead? If so, they must have had a level of self-knowledge, including an awareness of death. And yet those are the very characteristics used to define what makes us human. Did an equally advanced species inhabit Earth with us, or before us? Berger does not hesitate to address all these questions. Berger is a charming and controversial figure, and some colleagues question his interpretation of this and other finds. But in these pages, this charismatic and visionary paleontologist counters their arguments and tells his personal story: a rich and readable narrative about science, exploration, and what it means to be human.

**Anthropological Perspectives on Tooth Morphology** G. Richard Scott, Joel D. Irish, 2013-02-21 This follow-up to *The Anthropology of Modern Human Teeth* puts methods to use in interpreting human origins and affinities.

**Death Rituals and Social Order in the Ancient World** Colin Renfrew, Michael J. Boyd, Iain Morley, 2016 This volume, with essays by leading archaeologists and prehistorians, considers how prehistoric humans attempted to recognise, understand and conceptualise death.

*Spinal Evolution* Ella Been, Asier Gómez-Olivencia, Patricia Ann Kramer, 2019-08-07 The vertebral spine is a key element of the human anatomy. Its main role is to protect the spinal cord and the main blood vessels. The axial skeleton, with its muscles and joints, provides stability for the attachment of the head, tail and limbs and, at the same time, enables the

mobility required for breathing and for locomotion. Despite its great importance, the vertebral spine is often overlooked by researchers because: a) vertebrae are fragile in nature, which makes their fossilization a rare event; b) they are metameric (seriated and repeated elements) that make their anatomical determination and, thus, their subsequent study difficult; and c) the plethora of bones and joints involved in every movement or function of the axial skeleton makes the reconstruction of posture, breathing mechanics and locomotion extremely difficult. It is well established that the spine has changed dramatically during human evolution. Spinal curvatures, spinal load transmission, and thoracic shape of bipedal humans are derived among hominoids. Yet, there are many debates as to how and when these changes occurred and to their phylogenetic, functional, and pathological implications. In recent years, renewed interest arose in the axial skeleton. New and exciting finds, mostly from Europe and Africa, as well as new methods for reconstructing the spine, have been introduced to the research community. New methodologies such as Finite Element Analysis, trabecular bone analysis, Geometric Morphometric analysis, and gait analysis have been applied to the spines of primates and humans. These provide a new and refreshing look into the evolution of the spine. Advanced biomechanical research regarding posture, range of motion, stability, and attenuation of the human spine has interesting evolutionary implications. Until now, no book that summarizes the updated research and knowledge regarding spinal evolution in hominoids has been available. The present book explores both these new methodologies and new data, including recent fossil, morphological, biomechanical, and theoretical advances regarding vertebral column evolution. In order to cover all of that data, we divide the book into four parts: 1) the spine of hominoids; 2) the vertebral spine of extinct hominins; 3) ontogeny, biomechanics and pathology of the human spine; and 4) new methodologies of spinal research. These parts complement each other and provide a wide and comprehensive examination of spinal evolution.

*The Anthropology of Modern Human Teeth* G. Richard Scott, Christy G. Turner, Grant C. Townsend, María Martín-Torres, 2018-03-15 Complete guide to genetics, evolution, and variation in human tooth crown and root morphology in modern and fossil Homo sapiens.

*The Shanidar Neanderthals* Erik Trinkaus, 2014-05-10 The Shanidar Neanderthals describes the functional morphology of the Neanderthals and their place in human evolution based on a paleontological study of fossils discovered at Shanidar Cave in northeastern Iraq. Functional interpretations are provided that describe and discuss the individual fossils. The phylogenetic implications of the Shanidar specimens are also discussed. Comprised of 14 chapters, this book begins with an overview of the Neanderthal remains from the Shanidar Cave and the paleontological data obtained from the fossils. The discussion then turns to the history of the excavations in Shanidar Cave and the discoveries of the Neanderthals; morphometrics of the Shanidar remains; and determination of the age and sex of the Shanidar Neanderthals. Subsequent chapters focus on various aspects of the Neanderthal fossils, including the cranial and mandibular remains; the dental

remains; the axial skeleton; and the upper and lower limb remains. The immature remains are also described, along with bodily proportions and the estimation of stature. This monograph will be of interest to archaeologists, anthropologists, paleontologists, and paleopathologists.
