Coastal City Risks Yves Earhart, AI, 2025-02-21 Coastal City Risks examines the growing threats facing urban centers along coastlines due to climate change, exploring how these cities are adapting to rising sea levels and intensifying coastal hazards. The book uniquely integrates Earth Sciences, geography, and environmental studies to provide a comprehensive understanding of climate change adaptation and urban resilience. Intriguing facts within include the potential for large-scale displacement due to socio-economic impacts and the necessity of moving away from traditional top-down approaches in favor of more inclusive and equitable strategies. The book progresses logically, first establishing a scientific foundation of climate change and coastal geomorphology. It then analyzes the impacts on sectors like housing and transportation before evaluating adaptation pathways, such as infrastructure and policy instruments. Case studies from cities worldwide illustrate adaptation successes and failures, offering valuable lessons. The approach emphasizes not only physical sciences but also the social, economic, and political dimensions, making it a resource for policymakers, urban planners, and anyone interested in coastal management and climate policy.

Sustainable Management of Urban Water Resources Susanne Charlesworth, Craig Lashford, 2021-01-28 It is well known that 55% of the world's population currently lives in urban areas, and this figure is predicted to grow to 68% by 2050, adding more than 2.5 billion people to urban populations. It is also projected that there will be 43 megacities worldwide by 2030, with populations of more than 10 million inhabitants. The United Nations World Water Development Report, 2018, warned that by 2030, the global demand for fresh water is likely to exceed supply by 40%. Added to population growth, climate change has the potential to lead to changes in rainfall regimes, with the potential of increased flooding and drought. Currently, 1.2 billion people are at risk from flooding, but this is predicted to increase to about 1.6 billion, i.e., nearly 20% of the total world population, by 2050. In line with this, replacing deteriorating water management infrastructure that can no longer cope is economically unfeasible, impracticable from a construction point of view, and likely to fail in the long term. To address these issues, approaches are needed that are flexible and have multiple benefits. In its World Water Development Report, 2018, the UN promotes the use of nature-based solutions to some of these problems, with the focus of Sustainable Development Goal 6 (making sure that everyone has access to a safe and affordable supply of potable water and sanitation by 2030) requiring investment in suitable infrastructure across the world. This Special Issue covers the challenges faced in managing urban water in all its forms, from potable supplies to reuse and harvesting, as well as resilient and sustainable approaches developed to address flooding and drought.
