Microbiology James G. Cappuccino, Natalie Sherman, 2011 This is a user-friendly and practical guide for UK practitioners and those managing UK firms on the day-to-day legal issues that arise in the specialist field of partnerships and LLPs. The book is written by three authors: a leading partnership and LLP barrister with many years of litigation experience, a solicitor with specialist expertise in partnership and LLP structures and agreements, and a respected academic in the field. It provides clear and practical guidance on the main issues that arise time and again in UK partnerships and LLPs. While there are many important differences between traditional partnerships and LLPs, the practical issues that they face are often similar, and the book therefore tackle both areas. The focus is mainly on those areas that regularly cause difficulty in firms (be they traditional partnership or LLP). Subjects covered include: the legal nature and characteristics of partnerships and LLPs * factors influencing choice of legal entity * the essential elements of partnership and members' agreements * management structures including management boards and partnership councils * conduct of meetings * partnership/LLP property and profits and losses * accounts, taxation, and audit * partner and member retirements and expulsions * duties of partners and members * Equality Act implications * suspension and garden leave * personal liability issues * dissolution and winding-up * goodwill * disputes: mediation, arbitration, and court proceedings * mergers, acquisitions, and conversions.

Introductory Microbiology-I Dr. R Krishna Murthy, The book "Introductory Microbiology" consists of nine chapters covering all the basics required for the beginners in microbiology. The first chapter "Introduction to Microbiology" gives a

brief insight of the historical development of microbiology, pioneers in microbiology, developments and various branches of microbiology, and scope of microbiology. As microorganisms are ubiquitous in distribution, a need for the study of microbial techniques for the proper identification of microorganisms to scientists involved in applied research and industry for their exploitation. The author describes the various isolation and enumeration techniques of microorganisms in the second chapter "Isolation and Enumeration of Microorganisms". The author describes the stains, its types, and various staining methods in the third chapter "Staining Techniques" for the easy identification of various bacteria as they are quite colourless, transparent, and have a refractive index of the aqueous fluids wherein they're suspended. Microorganisms are too small (nanometers to micrometers) to be seen by our unaided eyes and therefore the microscopes are of crucial importance to view the microbes. Hence the author in the fourth chapter "Microscopy" have described the metric units, properties of light, basic quality parameters of microscopic image, the components of various light and electron microscopes with reference to their working principles, and limitations. The newer techniques in microscopy such as confocal, fluorescence, confocal, scanning probe, and atomic force microscope and application have also been described. Microbial cells are structurally complex, perform numerous functions, and have a need for carbon, energy, and electrons to construct new cellular components and do cellular work. Hence microorganisms should have a constant supply of nutrients, and a source of energy, which are ultimately derived from the organism's environment. The author in this fifth chapter "Microbial Nutrition" describes the basic common nutrients required for the microbial growth, nutritional types of microorganisms, nutritional and physical requirements of microbial growth, and the various nutrient uptake mechanisms with a special emphasis on the passive and active transport, group translocation, and Iron uptake. Culture is an in vitro technique of growing or cultivating microorganisms or only other cells in a suitable nutrients medium called a culture medium in the laboratory. A culture medium is a solid or liquid preparation used to grow, transport, and store microorganisms. Different microorganisms require different nutrient materials. All the microbiological studies depend on the ability to grow and maintain microorganisms in the laboratory which is possible only if suitable culture media are available. The author in the sixth chapter "Culture media and methods" have described the historical prospective of the culture medium, important factors for cultivation, common ingredients of a culture medium, classification of culture media based on consistency, nutritional component, and functional use, special culture techniques, and some of the commonly used laboratory media have been briefly described. People have been practicing disinfection and sterilization unknowingly since time immemorial, though the existence of microorganisms was unknown. The complete destruction or removal of all living microorganisms or their spores by any physical, chemical, or mechanical means is called sterilization. Sterilization can be accomplished by using heat, filtration, and gases. A satisfactory sterilization process is designed to ensure a high probability of achieving sterility. This author in the seventh chapter "Sterilization" have described the basic principles of sterilization, factors influencing the effectiveness of antimicrobial

agents, various physical and chemical agents and other agents of sterilization. The strain development is a primary step, in the process of fermentation or growth studies carried out in any fermentation process or microbiological research, which enables to increase the population of microorganisms from stock culture, to obtain cells in an active, and exponential growth phase. The author in the eighth chapter “Strain development and improvement” have described the historical prospective of fermentation with reference to brewing, and bakers yeast, development of inoculum for bacteria, and fungi. He has described the conventional (Metagenomics, genetic engineering, and mutation selection), and latest strain improvement methods such as the genomic, transcriptome, proteomic, and metabolome analysis. Microbial culture preservation aims at maintaining a microbial strain alive, uncontaminated, without variation or mutation. The author in the ninth chapter “Culture Preservation” describes the relevance of various culture preservation techniques with the objective of maintaining live strains, uncontaminated, and to prevent change in their characteristics.

Agriculturally Important Microorganisms Bibhuti Bhusan Mishra, Suraja Kumar Nayak, Avishek Pahari, 2021-11-23 The book encompasses different Agriculturally Important microorganisms (AIMs), mechanisms of action and modes of application for sustainable agriculture. The potential of microbes in nitrogen fixation, solubilizing nutrients like phosphorous, Potassium, tolerance to etc. are the major strength of the book. There is relatively a new frontier, use of Plant Growth Promoting Rhizobacteria (PGPR) in enhancing crop productivity. These microbes inhabit at the rhizospheric region of the root and facilitate plant growth through a variety of direct and indirect mechanisms. These PGP have been identified to solubilize phosphate, Potassium, Zinc, produce siderophore, IAA, Hydrogencyanide, fix ammonia and many more. Today, such microbes

are extensively studied not only as a biofertilizer or fortification of nutrient to the plant, but also a potential agent to decrease application of chemical fertilizer and other agrochemicals. The book also gives an insight to this aspect also. Last but not the least, a light has been thrown on use and application of nano-biofertilizer for sustainable agriculture. Note: T&F does not sell or distribute the hardback in India, Pakistan, Nepal, Bhutan, Bangladesh and Sri Lanka. This title is co-published with NIPA.
